

## Genomes & Diversity

As of August of 2013, Gramene hosts a total of 27 complete and 9 partial genomes. In collaboration with Ensembl Genomes, for each reference genome we incorporate community annotation from primary sources and enrich this information with a series of standardized analyses. These include functional annotation by InterProScan and classification using controlled vocabularies (e.g., GO and PO). Evolutionary histories are provided by Compara phylogenetic gene trees and complemented by analyses of whole genome alignments. In recent years, Gramene has positioned itself as a resource for genome variation data in *Arabidopsis*, rice & “African rice”, barley, maize, sorghum, wheat, grape, and *Brachypodium*.

## Pathways & Networks

Gramene produces and hosts or mirrors metabolic pathways databases and visualization tools in the BioCyc collection.

We recently introduced the Plant Reactome [<http://plantreactome.oicr.on.ca>], a new platform for the comparative analysis of plant metabolic and regulatory networks, produced in collaboration with the Human Reactome Project. The current release of Plant Reactome includes a beta version of the rice pathways database based on RiceCyc v3.3. We plan to include *Arabidopsis* pathways later this Summer, and eventually projections to maize and other plant species.

## Outreach & Releases

Our release cycle is moving from two to five major releases per year, ensuring timely updates to data and software. We reach our users at key scientific meetings including ASPB's Plant Biology, Maize Genetics Conference, International Conference on Arabidopsis Research, and Plant and Animal Genomes. Gramene participates in several Research Coordination Networks to understand community needs and to establish and promote common data exchange formats.

## Web Services

- Gramene Mart for customized data dumps
- DAS for sequence alignments
- Public MySQL server
- Entry points for TASSEL, Flapjack and PICARA
- RESTful API

## Comparative genomics across the plant kingdom

<http://www.gramene.org/>

Gramene continues to grow, now at 27 complete genomes (build 38), including crops, model organisms and lower plants. Together these serve as a reference resource for comparative analyses, for the broad scientific community, in support of basic and translational research which impact societal interests in food security, energy production, and climate change.
